

## Homogenization protocol for Arabidopsis thaliana stem using Bullet Blender

## Materials:

Samples: 35 mg of fresh stem Bead lysis kit: 1.5 mL RINO/Eppendorf Lysis Kit (SKU: NAVYR1/NAVYR5 or NAVYE1/NAVYE5) Buffer volume: 300 to 600 μL of buffer

## Method - Homogenization:

- 1. Determine the sample size, buffer (depends on the downstream application), buffer volume and the bead lysis kit. *Note:* Choose the correct lysis kit for optimal homogenization.
- 2. Cut the sample and place into the buffer-filled tubes.
- 3. Close the tubes tightly and place into the Bullet Blender. *Note: Confirm the compatibility of the* <u>contact</u> <u>plate</u> with the tubes (RINO/EPPENDORF) used.
- 4. Set the speed and time on the Bullet Blender (Table 1). Press "Start", and wait for the run to complete.

Bullet Blender Model	Settings
BB24-AU or BT24M	Speed 10; Time 5 - Dry> Speed 10; Time 5 - Wet

- 5. Remove the tubes and visually inspect the samples to confirm complete homogenization. *Note:* Foaming in the sample tubes may be observed after homogenization.
- 6. If homogenization is satisfactory, proceed with the downstream steps.
